

Word-Tac-Toe: two screens, redesigned

A response to the playtest notes: the game needs to teach its own flow, feel encouraging rather than scored, and read as a real WiggleWoo screen instead of a functional prototype. Mockups below are built to the project's own tablet reference frame (1366×1024 landscape) and its existing palette " teal/orange are already WiggleWoo's X/O colors in `theme.css`, not new choices.

PROBLEM

No onboarding " the tap target and the learning task were both invisible on first play.

PROBLEM

Board read as nine gray boxes; challenge card felt like a modal dropped on top of the game.

FIX

A taught sequence (pick your piece " tap a square " answer " placed " CPU's turn), a themed board, and a challenge drawer that opens out of the board instead of covering it.

Choose your piece!

Play as X

Play as O

WHY IT'S HERE

This is the missing first beat â€” the child commits to "I am teal X" or "I am orange O" before anything else happens, so every later reference to "your square" already means something.

ASSET NOTE

Mascot shown here as a placeholder teal/orange character â€” swap in the real `wigg lewoo_X.png` / `wigg lewoo_0.png` poses at build time, same badge-and-circle framing.

KIOSK BUILD

Same screen, same choice â€” kiosk players get the identical taught flow, just auto-advancing afterward instead of waiting on a Continue tap.

02 The board, mid-game

redesigned

â 2 in a row!

Choose the missing letter to take your turn!

c _ t ât' which letter is missing?

a o u

CHARACTER, INTEGRATED

WiggleWoo moves into the top instruction bar as a small portrait speaking the current line â€” not a sprite floating beside the board. Portrait swaps to the CPU's piece pose on WiggleWoo's own turn ("My turn!").

BOARD AS AN OBJECT

Warm wood-and-parchment game-mat panel with a thick painted border, not gray divs. Dashed hand-drawn-style grid lines. Empty cells carry a soft pulsing glow to invite the next tap.

CONNECTED, NOT A MODAL

The challenge drawer opens from the board's bottom edge with a matching border color and a small tab connector â€” the board dims only slightly behind it (6% scrim, shown here), it never fully disappears under a dark overlay.

STREAK, KEPT SMALL

A single corner chip, not a scoreboard â€” appears after 2+ correct in a row, fades on its own. No running total displayed anywhere.

03 The taught sequence

flow, not just visuals

01

Choose your piece â€” X or O, once, at the start.

02

Speech bar: "Tap a square to make your move!"

03

Tap opens the drawer: "Choose the missing letter" / "Which word matches the picture?"

04

Correct answer â†’ piece places itself in that square, drawer closes.

05

WiggleWoo's turn plays instantly with the opposite piece, then hands back.

04 Palette in use

from theme.css â€” nothing new

 --ww-teal-dark Â· X piece  --ww-teal-light Â· X card fill  --ww-orange (deepened for AA text) Â· O piece
 --ww-orange-light Â· O card fill  --ww-gold (deepened) Â· streak chip  --ww-bg-warm Â· screen ground  --ww-text Â· ink

Built to the project's 1366Ã—1024 iPad-Pro reference ratio â€” scales down via the existing fixed-canvas + transform approach used everywhere else in the game, not a separate mobile layout. Nothing here is final art: approve the direction, then it gets built in `WordTacToeScreen.tsx` with the real character poses and word-image assets.
